- 4 Exercises

- Reliability
  - Failure Density, Reliability and Hazard Rate
  - Common Distributions for Reliability Studies
- 2 Basic Statistics
- Supplementary Materials
- 4 Exercises

### **Definitions**

Suppose A is a black box unit.

- Failure density  $f_A$ : distribution of the time T that A fails.
- **Reliability function**  $R_A$ : the probability that A is working at time t,  $R_A(t) = 1 F_A(t)$ .
- Hazard rate  $\rho_A$ :

$$\rho_{A}(t) := \lim_{\Delta t \to 0} \frac{P[t \le T \le t + \Delta t | t \le T]}{\Delta t}$$

$$= \lim_{\Delta t \to 0} \frac{P[t \le T \le t + \Delta t]}{P[T \ge t] \cdot \Delta t} = \frac{f_{A}(t)}{R_{A}(t)},$$

$$R_{A}(t) = e^{-\int_{0}^{t} \rho_{A}(x) dx}.$$

One often has information on  $\rho_A$ , but not  $F_A$  or  $R_A$ .

# Series and Parallel Systems

• Series system with *k* components.

$$R_s(t) = \prod_{i=1}^k R_i(t),$$

where  $R_i$  is the reliability of the i-th component.

• Parallel system with *k* components.

$$R_p(t) = 1 - \prod_{i=1}^k (1 - R_i(t)).$$

### **Exponential Distribution**

ullet Density function. eta>0 is a parameter,

$$f(x) = \left\{ egin{array}{ll} eta e^{-eta x}, & x > 0, \\ 0, & ext{otherwise}. \end{array} 
ight.$$

Mean.

$$\mu = \frac{1}{\beta}.$$

Variance.

$$\sigma^2 = \frac{1}{\beta^2}.$$

Reliability features.

$$\rho(t) = \beta, \ R(t) = e^{-\beta t}, \ f(t) = \rho(t)R(t) = \beta e^{-\beta t}.$$

### Weibull Distribution

ullet Density function. lpha, eta > 0 are parameters,

$$f(x) = \begin{cases} \alpha \beta x^{\beta - 1} e^{-\alpha x^{\beta}}, & x > 0, \\ 0, & \text{otherwise.} \end{cases}$$

Mean.

$$\mu = \alpha^{-1/\beta} \Gamma(1 + 1/\beta).$$

Variance.

$$\sigma^2 = \alpha^{-2/\beta} \Gamma(1 + 2/\beta) - \mu^2.$$

Reliability features.

$$\rho(t) = \alpha \beta t^{\beta-1}, \ R(t) = e^{-\alpha t^{\beta}}, \ f(t) = \rho(t)R(t) = \alpha \beta t^{\beta-1}e^{-\alpha t^{\beta}}.$$

- 4 Exercises

#### **Definitions**

- **Statistics** aims to gain information about the parameters of a distribution by conducting experiments.
- Population: a large collection of instances which we want to describe probability.
- Random sample of size n from distribution of X: a collection of n independent random variables  $X_1, \ldots, X_n$ , each with the same distribution as X. ( $\Leftrightarrow n$  i.i.d. random variables.)
- x-th percentiles:  $d_x$  such that x% of values in sampled data are less than or equal to  $d_x$ . (first, second, third quartile  $\Rightarrow x = 25, 50, 75$ .)
- Interquartile range:  $IQR = q_3 q_1$ , measures the dispersion of the data.
- **Precision**: smallest decimal place of data  $\{x_1, \ldots, x_n\}$ .
- Sample range:  $\max\{x_i\} \min\{x_i\}$ .

# Visualization — Histograms

#### Choose bin width / number of bins.

Sturges's rule.

$$k = \lceil \log_2(n) \rceil + 1, \qquad h = \frac{\max\{x_i\} - \min\{x_i\}}{k},$$

rounding *up* to the precision of the data.

• Freedman-Diaconis rule.

$$h = \frac{2 \cdot \mathsf{IQR}}{\sqrt[3]{n}}.$$

#### Sketch.

- ① Choose bin width *h*.
- ② Find minimum of data min $\{x_i\}$ , subtract 1/2 of precision.
- Successively add bin width and categorize all the data.

# Visualization — Stem-and-Leaf Diagrams

### Steps.

- Choose a convenient number of leading decimal digits to serve as stems.
- 2 Label the rows using the stems.
- For each datum of the random sample, note down the digit following the stem in the corresponding row.
- Turn the graph on its side to get an impression of its distribution.

# Visualization — Stem-and-Leaf Diagrams

# Visualization — Boxplots

- Calculate  $q_1, q_2, q_3$  and IQR.
- Find inner fences and outer fences by

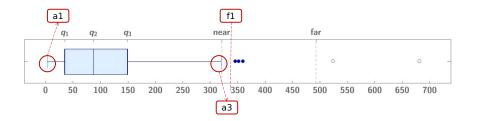

$$f_1 = q_1 - \frac{3}{2}IQR,$$
  $f_3 = q_3 + \frac{3}{2}IQR,$   $F_1 = q_1 - 3IQR,$   $F_3 = q_3 + 3IQR,$ 

and find adjacent values

$$a_1 = \min\{x_k : x_k \ge f_1\}, \qquad a_3 = \max\{x_k : x_k \le f_3\}.$$

Identify near outliers and far outliers.

- 4 Exercises

### **Definitions**

- **Statistic**: a <u>random variable</u> that is derived from  $X_1, \ldots, X_n$ .
- *Estimator*: a statistic that is used to estimate a population parameter.
- Point estimate: a value of the estimator.
- *Unbiased*: expectation of an estimator  $\widehat{\theta}$  is equal to the true parameter.

$$\mathsf{E}[\widehat{\theta}] = \theta, \qquad \mathsf{bias} = \theta - \mathsf{E}[\widehat{\theta}].$$

Mean square error.

$$\begin{split} \mathsf{MSE}(\widehat{\theta}) &= \mathsf{E}[(\widehat{\theta} - \theta)^2] \\ &= \mathsf{E}[(\widehat{\theta} - \mathsf{E}[\widehat{\theta}])^2] + (\theta - \mathsf{E}[\widehat{\theta}])^2 \\ &= \mathsf{Var}[\widehat{\theta}] + (\mathsf{bias})^2. \end{split}$$

### Estimating Parameters — The Method of Moments

Method of moments. Given a random sample  $X_1, \ldots, X_n$  of a random variable X, for any integer  $k \geq 1$ ,

$$\widehat{\mathsf{E}[X^k]} = \frac{1}{n} \sum_{i=1}^n X_i^k$$

is an unbiased estimator for the kth moment of X. Proof. Denote  $\mu_k = \mathbb{E}[X^k]$ , then

$$E\left[\widehat{\mu_k}\right] = E\left[\frac{1}{n}\sum_{i=1}^n X_i^k\right]$$
$$= \frac{1}{n}\sum_{i=1}^n E[X_i^k] = \frac{1}{n} \cdot n\mu_k = \mu_k.$$

### Estimating Parameters — Method of Maximum Likelihood

Method of maximum likelihood. Given a random sample  $X_1, \ldots, X_n$  of a random variable X with parameter  $\theta$  and density  $f_X$ , the *likeliho-od function* is given by

$$L(\theta) = \prod_{i=1}^n f_X(x_i).$$

The maximum likelihood estimator (MLE) of  $\theta$  is given by

$$\widehat{\theta} = \underset{\theta}{\operatorname{arg\,max}} L(\theta).$$

In most of the cases, we equivalently maximize the log-likelihood

$$\ell(\theta) = \ln L(\theta), \qquad \widehat{\theta} = \arg\max_{\theta} \ell(\theta).$$

# Estimating Mean

#### Method of moments.

ullet Estimating mean  $\mu$ .

$$\widehat{\mu} = \frac{1}{n} \sum_{i=1}^{n} X_i.$$

• Biasness. As we have noted earlier,

$$\mathsf{E}\left[\widehat{\mu}\right] = \mu.$$

# **Estimating Mean**

Maximum likelihood estimate. Suppose X follows a normal distribut-ion with <u>unknown</u> mean  $\mu$  and <u>known</u> variance  $\sigma^2$ , and we wish to estimate mean  $\mu$ .

• Estimating mean  $\mu$ .

$$\begin{split} L(\mu) &= \frac{1}{(2\pi)^{n/2}\sigma^n} \exp\left[\frac{1}{\sigma^2} \left(\sum_{i=1}^n X_i^2 - 2\mu \sum_{i=1}^n X_i + n\mu^2\right)\right]. \\ \widehat{\mu} &= \arg\max_{\mu} \left\{-\frac{n}{2} \ln(2\pi\sigma^2) + \frac{1}{\sigma^2} \left(\sum_{i=1}^n X_i^2 - 2\mu \sum_{i=1}^n X_i + n\mu^2\right)\right\} \\ &= \frac{1}{n} \sum_{i=1}^n X_i. \end{split}$$

Biasness. As seen earlier, the estimator is unbiased.

### **Estimating Variance**

#### Method of moments.

• Estimating variance  $\sigma^2$ .

$$\widehat{\sigma^2} = \widehat{\mathsf{E}[X^2]} - \widehat{\mathsf{E}[X]}^2 = \frac{1}{n} \sum_{i=1}^n X_i^2 - \left(\frac{1}{n} \sum_{i=1}^n X_i\right)^2.$$

Biasness. This estimator is not unbiased since

$$E[X_i^2] = Var[X_i] + E[X_i]^2 = \sigma^2 + \mu^2,$$
  
$$E[\overline{X}^2] = Var[\overline{X}] + E[\overline{X}]^2 = \frac{\sigma^2}{n} + \mu^2,$$

and thus

$$\mathsf{E}[\widehat{\sigma^2}] = \sigma^2 + \mu^2 - \frac{\sigma^2}{n} - \mu^2 = \frac{n-1}{n}\sigma^2 \neq \sigma^2.$$

◆ロト ◆御 ト ◆ 恵 ト ◆ 恵 ・ 釣 へ ○

# **Estimating Variance**

Maximum likelihood estimate. Suppose X follows a Poisson distribution with parameter k, and we wish to estimate variance k (since both mean and variance of Poisson distribution are k).

• Estimating variance k. We know from lecture slides that

$$L(k) = e^{-nk} \frac{k^{\sum X_i}}{\prod X_i!},$$

$$\widehat{k} = \arg\max_{k} \left\{ -nk + \ln k \sum_{i=1}^{n} X_i - \ln \prod_{i=1}^{n} X_i \right\}$$

$$= \frac{1}{n} \sum_{i=1}^{n} X_i.$$

• <u>Biasness</u>. Although both the MLE estimate for mean and variance are sample mean, the estimators are unbiased.

4□ > 4□ > 4 = > 4 = > = 90

### Summary

Unbiased estimator for mean and variance.

$$\widehat{\mu} = \frac{1}{n} \sum_{i=1}^{n} X_i, \qquad \widehat{\sigma^2} = S^2 = \frac{1}{n-1} \sum_{i=1}^{n} (X_i - \overline{X})^2.$$

Unbiased estimator for moments.

$$\widehat{\mathsf{E}[X^k]} = \frac{1}{n} \sum_{i=1}^n X_i^k.$$

MLE estimator for parameters.

$$\widehat{\theta} = \underset{\theta}{\operatorname{arg\,max}} \ L(\theta) = \underset{\theta}{\operatorname{arg\,max}} \ \ell(\theta) = \underset{\theta}{\operatorname{arg\,max}} \ \sum_{i=1}^{n} \ln f_X(x_i).$$

#### Confidence Intervals

Definition. Let  $0 \le \alpha \le 1$ . A  $100(1-\alpha)\%$  (two-sided) confidence interval for a parameter  $\theta$  is an interval  $[L_1, L_2]$  such that

$$P[L_1 \le \theta \le L_2] = 1 - \alpha.$$

In most cases, we use *centered confidence interval* with

$$P[\theta < L_1] = P[\theta > L_2] = \frac{\alpha}{2}.$$

The  $100(1-\alpha)\%$  upper confidence bound and lower confidence bound for  $\theta$  are given by  $L_u, L_l$  such that

$$P[\theta \le L_u] = 1 - \alpha, \qquad P[L_l \le \theta] = 1 - \alpha.$$

#### Standard normal distribution.

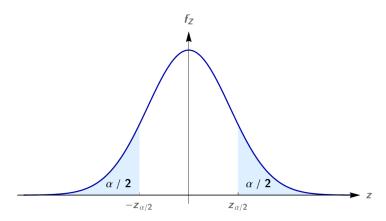

• Density function.

$$f_Z(z) = \frac{1}{\sqrt{2\pi}} e^{z^2/2}, \qquad z \in \mathbb{R}.$$

• Statistical values. Command for x such that  $P[X \ge x] = p$ : InverseCDF[NormalDistribution[0, 1], 1-p].

$$\alpha = 0.05 \quad \Rightarrow \quad z_{\alpha} = 1.64485, \quad z_{\alpha/2} = 1.95996.$$

#### Standard normal distribution.

#### Chi-squared distribution.

• Origin.  $Z_1, \ldots, Z_n$  are i.i.d. random variables.

$$Z_i \sim \mathsf{Normal}(0,1) \quad \Rightarrow \quad \chi_n^2 = \sum_{i=1}^n Z_i^2 \sim \mathsf{ChiSquared}(n).$$

• Density function.  $f_{\chi_n^2}(x) = 0$  for x < 0 and

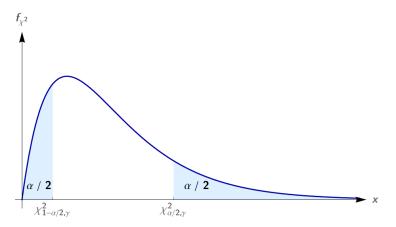

$$f_{\chi_n^2}(x) = \frac{1}{2^{n/2}\Gamma(n/2)} x^{n/2-1} e^{-x/2}, \qquad x \ge 0,$$

where n is the degree of freedom.

• Statistical values. Command for x such that  $P[X \ge x] = p$ : InverseCDF[ChiSquareDistribution[n], 1-p].

### Chi-squared distribution.

#### Chi distribution.

• Origin.  $Z_1, \ldots, Z_n$  are i.i.d. random variables.

$$Z_i \sim \mathsf{Normal}(0,1) \quad \Rightarrow \quad \chi_n = \sqrt{\sum_{i=1}^n Z_i^2} \sim \mathsf{Chi}(n).$$

• Density function.  $f_{\chi_n}(x) = 0$  for x < 0 and

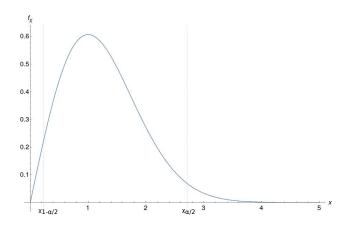

$$f_{\chi_n}(x) = \frac{2}{2^{n/2}\Gamma(n/2)}x^{n-1}e^{-x^2/2}, \qquad x \ge 0,$$

where n is the degree of freedom.

• Statistical values. Command for x such that  $P[X \ge x] = p$ : InverseCDF[ChiDistribution[n], 1-p].

◆ロト ◆個ト ◆差ト ◆差ト 差 めのぐ

#### Chi distribution.

#### Student T-distribution.

• Origin.  $Z, \chi^2_{\gamma}$  are i.i.d. random variables such that

$$Z \sim \mathsf{Normal}(0,1), \qquad \chi_{\gamma}^2 \sim \mathsf{ChiSquared}(\gamma), \ \Rightarrow \quad T_{\gamma} = rac{Z}{\sqrt{\chi_{\gamma}^2/\gamma}} \sim \mathsf{StudentT}(\gamma).$$

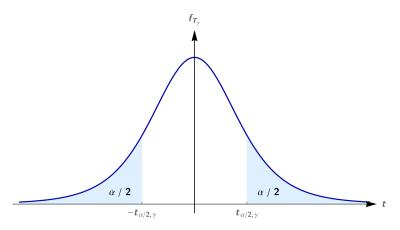

Density function.

$$f_{\mathcal{T}_{\gamma}}(t) = rac{\Gamma((\gamma+1)/2)}{\Gamma(\gamma/2)\sqrt{\pi\gamma}} \left(1 + rac{t^2}{\gamma}
ight)^{-rac{\gamma+1}{2}}, \qquad t \in \mathbb{R}.$$

• Statistical values. Command for x such that  $P[X \ge x] = p$ : InverseCDF[StudentTDistribution[n], 1-p].

#### Student T-distribution.

### Summary

Suppose  $X_1, \ldots, X_n$  are samples from a population X, where X follows normal distribution with mean  $\mu$  and variance  $\sigma^2$ .

Normal distribution.

$$Z = rac{\overline{X} - \mu}{\sigma/\sqrt{n}} \sim \mathsf{Normal}\left(0,1
ight).$$

Chi-squared distribution.

$$\chi^2_{n-1} = \frac{(n-1)S^2}{\sigma^2} \sim \text{ChiSquared}(n-1).$$

Chi distribution.

$$\chi_{n-1} = \sqrt{\frac{(n-1)S^2}{\sigma^2}} \sim \operatorname{Chi}(n-1).$$

Student T-distribution.

$$T_{n-1} = \frac{\overline{X} - \mu}{S/\sqrt{n}} \sim \text{StudentT}(n-1).$$

# Interval Estimation for Mean (Variance Known)

Mean. Suppose we have a random sample of size n from a normal population with unknown mean  $\mu$  and known variance  $\sigma^2$ .

• Statistic and distribution.

$$Z = rac{\overline{X} - \mu}{\sigma/\sqrt{n}} \sim \mathsf{Normal}\left(0,1
ight).$$

•  $100(1-\alpha)\%$  two-sided confidence interval for  $\mu$ .

$$\overline{X} \pm \frac{z_{\alpha/2} \cdot \sigma}{\sqrt{n}}$$
.

•  $100(1-\alpha)\%$  one-sided interval for  $\mu$ .

$$L_u = \overline{X} + \frac{z_\alpha \cdot \sigma}{\sqrt{n}}, \qquad L_I = \overline{X} - \frac{z_\alpha \cdot \sigma}{\sqrt{n}}.$$

# Interval Estimation for Mean (Variance Unknown)

Mean. Suppose we have a random sample of size n from a normal population with unknown mean  $\mu$  and unknown variance  $\sigma^2$ .

• Statistic and distribution.

$$\mathcal{T}_{n-1} = rac{\overline{X} - \mu}{S/\sqrt{n}} \sim \mathsf{StudentT}\left(n-1
ight).$$

•  $100(1-\alpha)\%$  two-sided confidence interval for  $\mu$ .

$$\overline{X} \pm \frac{t_{\alpha/2,n-1}S}{\sqrt{n}}$$
.

•  $100(1-\alpha)\%$  one-sided interval for  $\sigma^2$ .

$$L_u = \overline{X} + \frac{t_{\alpha,n-1}S}{\sqrt{n}}, \qquad L_I = \overline{X} - \frac{t_{\alpha,n-1}S}{\sqrt{n}}.$$

### Interval Estimation for Variance

Variance. Suppose we have a random sample of size n from a normal population with unknown mean  $\mu$  and unknown variance  $\sigma^2$ .

• Statistic and distribution.

$$\chi_{n-1}^2 = \frac{(n-1)S^2}{\sigma^2} \sim \mathsf{ChiSquared}(n-1).$$

•  $100(1-\alpha)\%$  two-sided confidence interval for  $\sigma^2$ .

$$\left[\frac{(n-1)S^2}{\chi^2_{\alpha/2,n-1}},\frac{(n-1)S^2}{\chi^2_{1-\alpha/2,n-1}}\right].$$

•  $100(1-\alpha)\%$  one-sided interval for  $\sigma^2$ .

$$L_u = \frac{(n-1)S^2}{\chi^2_{1-\alpha,n-1}}, \qquad L_I = \frac{(n-1)S^2}{\chi^2_{\alpha,n-1}}.$$

### Interval Estimation for Standard Deviation

Std. Deviation. Suppose we have a random sample of size n from a normal population with unknown mean  $\mu$  and unknown variance  $\sigma^2$ .

• Statistic and distribution.

$$\chi_{n-1} = \sqrt{rac{(n-1)S^2}{\sigma^2}} \sim \mathsf{Chi}\,(n-1)\,.$$

•  $100(1-\alpha)\%$  two-sided confidence interval for  $\sigma^2$ .

$$\left[\frac{\sqrt{(n-1)S^2}}{\chi_{\alpha/2,n-1}},\frac{\sqrt{(n-1)S^2}}{\chi_{1-\alpha/2,n-1}}\right].$$

•  $100(1-\alpha)\%$  one-sided interval for  $\sigma^2$ .

$$L_u = \frac{\sqrt{(n-1)S^2}}{\chi_{1-\alpha,n-1}}, \qquad L_l = \frac{\sqrt{(n-1)S^2}}{\chi_{\alpha,n-1}}.$$

### Suppose we obtain n = 70 sample points from simulation.

```
M+ > X = Round[RandomVariate[NormalDistribution[4.5, 2], 70], 0.01]

OM+ > [1.67, 3.6, 2.67, 11.3, 3.86, 2.67, 4.43, 5.86, 3.12, 2.86, 7.24, 3.31, 4.98, 6.68, 3.27, 6.32,
3.94, 4.14, 4.9, 1.98, 7.27, 5.84, 1.33, 7.86, 4.12, 2.39, 9., 5.03, 6.03, 7.85, 1.94, 3.52, 5.49, 6.57,
8.9, 7.73, 5.18, 4.3, 7.37, 5.02, 6.82, 1.24, 3.66, 0.94, 2.22, 5.37, 3.13, 2.44, 3.43, 3.89, 4.53, 1.37,
4.88, 3.15, 1.63, 0.62, 3.49, 3.06, 2.76, 5.47, 3.26, 5.77, 6.64, 5.74, 2.19, 1.42, 3.82, 2.76, 2.29, 6.93}
```

#### We would like to:

- visualize these data points,
- obtain point estimates for mean and variance (suppose they are unknown), and
- obtain interval estimates for
  - mean when variance is known,
  - mean and variance when variance is unknown.

Histogram. Using Freedman-Diaconis Rule,

$$q_1 = 2.76$$
,  $q_3 = 5.84$   $\Rightarrow$  IQR =  $q_3 - q_1 = 3.08$ ,

and

$$h = \frac{2IQR}{\sqrt[3]{n}} = 1.49468 \approx 1.50$$
 (rounding up).

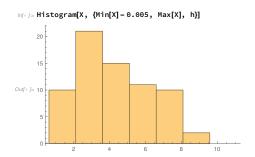

Then the lower bound of the first bin is

$$\min\{x_i\} - \text{pre.}/2 = 0.62 - 0.005 = 0.615.$$

#### Histogram.

# SP20 Assignment 3.4

A mathematics textbook has 200 pages on which typographical errors in the equations could occur. Suppose there are in fact five errors randomly dispersed among these 200 pages.

- What is the probability that a random sample of 50 pages will contain at least one error?
- How large must the random sample be to assure that at least three errors will be found with 90% probability? (You may use a normal approximation to the binomial distribution.)

- Reliability
- 2 Basic Statistics
- Supplementary Materials
- 4 Exercises
  - Exercise 1.
  - Exercise 2.
  - Exercise 3.

# SP20 Assignment 3.11

A system consists of two independent components connected in series. The life span (in hours) of the component follows a Weibull distribution with  $\alpha=0.006$  and  $\beta=0.5$ ; the second has a lifespan in hours follows the exponential distribution with  $\beta=1/25000$ .

- Find the reliability of the system at 2500 hours.
- Find the probability that the system will fail before 2000 hours.
- If the two components are connected in parallel, what is the system reliability at 2500 hours?

- Reliability
- Basic Statistics
- Supplementary Materials
- 4 Exercises
  - Exercise 1.
  - Exercise 2.
  - Exercise 3.

# SP20 Assignment 4.2 I

Let  $X_1, \ldots, X_n$  be a random sample of size n from a random variable with variance  $\sigma^2$ . We have seen that the sample variance

$$S_{n-1}^2 := \frac{1}{n-1} \sum_{k=1}^n (X_k - \overline{X})^2$$

is an unbiased estimator for  $\sigma^2$ . It can be shown that

$$Var(S_{n-1}^2) = MSE(S_{n-1}^2) = \frac{1}{n} \left( E[(X - \overline{X})^4] - \frac{n-3}{n-1} \sigma^4 \right) = \frac{1}{n} \left( \gamma_2 + \frac{2n}{n-1} \right)$$
(1)

where  $\gamma_2 := E[(X-\mu)^4]/\sigma^4 - 3$  is called the *excess kurtosis* of a distribution.

# SP20 Assignment 4.2 II

 $\textbf{9} \ \, \text{Show that if $X$ follows a normal distribution with mean $\mu$ and variance $\sigma^2$,}$ 

$$\mathsf{MSE}(S_{n-1}^2) = \frac{2}{n-1}\sigma^4.$$

② For a > 0 set

$$S_a^2 := \frac{n-1}{a} S_{n-1}^2.$$

Find  $MSE(S_a^2)$  and show that the mean square error is minimized for

$$a=n+1+\frac{n-1}{n}\gamma_2.$$

In the case of a normal distribution with mean  $\mu$  and variance  $\sigma^2$ , show that this reduces to a = n + 1.
